EXHIBIT "A"

38474

- (a) USGS and recent private hydrological and geological studies conclude that there is an impervious clay layer 153 feet thick beginning 207 feet from the surface to the 360 foot level under this immediate area. Below this layer is a permeable fractured granite yielding water and traceable to a source outside of Lemmon Valley.
- b) Existing nearby users are drawing their water from the underground reservoir above the 207 foot level and above the aforementioned impervious clay layer.
- (c) Applicant agrees to seal off the upper 300 feet of the well; therefore, applicants use will not effect existing users in the area
- (d) Applicant believes the recent abandonment of large wells and applications nearby provides sufficient relief on the existing source area to grant this application.
- (e) This application is in conjunction with another application of this date; it being understood that only one well will be used at a time (the other being for back up purposes only). Total use of both wells will never exceed 300 gallons per minute.
